Oficio Nº CTO-Q-2017-23

Ing. Galo Maldonado, **ADMINISTRADOR DEL CONTRATO EMGIRS – EP**

Presente.-

De nuestras consideraciones:

**Tema: Informe de resultados de ensayos de suelo y agua en El Troje 4**

Como complemento a lo informado en oficio Nº CTO-Q-2017-19, adjuntamos los reportes de los laboratorios que realizaron el estudio de estabilidad del suelo de las bermas de la escombrera El Troje 4 y la calidad del agua de percolación de los lodos recibidos en los cubetos.

El Laboratorio de Materiales de Construcción de la Pontificia Universidad Católica del Ecuador, analizó muestras inalteradas de las bermas conformadas en la operación de la Fase I, específicamente en la berma Nº13, de la cual se evaluaron 3 probetas que luego de ser sometidas al **ensayo triaxial** reportan como conclusión que el esfuerzo de cizalladura corresponde a 88,09 kPa y el ángulo de resistencia al cizallamiento es de 26,73 degrees, siendo su contenido de humedad 25%, su Límite Líquido LL 37, su Límite Plástico LP 26, su índice de Plasticidad IP 10, correspondiendo a una clasificación de suelo SUCS ML (Limo con Arena) cuya granulometría se define compuesta por 1% de grava, 28 % de arena y 72% de finos, sin contenido orgánico.

En el análisis de las muestras inalteradas de las bermas conformadas en la operación de la Fase II, específicamente en la berma Nº4, de la cual se evaluaron 3 probetas que luego de ser sometidas al **ensayo triaxial** reportan como conclusión que el esfuerzo de cizalladura corresponde a 46,16 kPa y el ángulo de resistencia al cizallamiento es de 32,37 degrees, siendo su contenido de humedad 26%, su Límite Líquido LL 34, su Límite Plástico LP 25, su índice de Plasticidad IP 9, correspondiendo a una clasificación de suelo SUCS ML (Limo Arenoso) cuya granulometría se define compuesta por 0% de grava, 32 % de arena y 68% de finos, sin contenido orgánico.

En el oficio anterior se adjuntó la planificación de conformación de plataformas y sus bermas donde se observa que el talud planificado tiene un ángulo de inclinación menor al definido en el estudio de estabilidad de la PUCE, con lo cual confirmamos que estamos usando un factor de

## CUMPLIMIENTO DE PLAN DE MITIGACIÓN

Para monitorear los posibles desplazamientos de las masas de la escombrera, hemos colocado mojones testigos en sitios estratégicos cuyas coordenadas y cotas iniciales están siendo monitoreadas mensualmente cuando realizamos levantamientos topográficos de control y cuyos resultados presentaremos una vez que recibamos el reporte indicado conjuntamente con el diseño de los cubetos ubicados entre las plataformas Norte y Sur.

## MONITOREO CALIDAD DEL AGUA DE ESCORRENTÍA E INFILTRACIÓN DE LA ESCOMBRERA.

- El informe de resultados del Laboratorio Analítico Ambiental de Agua - Efluentes Industriales LASA, evidencia que el parámetro de Demanda Química de Oxígeno DQO no se cumple, sin embargo indicamos que hemos realizado un nuevo monitoreo para analizar todos los parámetros de la Tabla 9 de límites de descarga a un cuerpo de agua dulce de la Norma Técnica – Anexo 1-1, cuyos resultados serán entregados en 15 días.

Sírvase encontrar adjunto los informes de laboratorio de las entidades mencionadas.

Atentamente,

Ing. Rodrigo Almeida  
Director de Obra

Oficio Nº CTO-Q-2017-23

Ing. Galo Maldonado, ADMINISTRADOR DEL CONTRATO EMGIRS – EP  
Presente.-

De nuestras consideraciones:

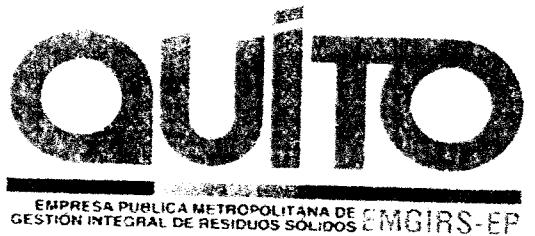

Tema: Informe de resultados de ensayos de suelo y agua en El Troje 4

Como complemento a lo informado en oficio Nº CTO-Q-2017-19, adjuntamos los reportes de los laboratorios que realizaron el estudio de estabilidad del suelo de las bermas de la escombrera El Troje 4 y la calidad del agua de percolación de los lodos recibidos en los cubetos.

El Laboratorio de Materiales de Construcción de la Pontificia Universidad Católica del Ecuador, analizó muestras inalteradas de las bermas conformadas en la operación de la Fase I, específicamente en la berma Nº13, de la cual se evaluaron 3 probetas que luego de ser sometidas al ensayo triaxial reportan como conclusión que el esfuerzo de cizalladura corresponde a 88,09 kPa y el ángulo de resistencia al cizallamiento es de 26,73 degrees, siendo su contenido de humedad 25%, su Límite Líquido LL 37, su Límite Plástico LP 26, su índice de Plasticidad IP 10, correspondiendo a una clasificación de suelo SUCS ML (Limo con Arena) cuya granulometría se define compuesta por 1% de grava, 28 % de arena y 72% de finos, sin contenido orgánico.

En el análisis de las muestras inalteradas de las bermas conformadas en la operación de la Fase II, específicamente en la berma Nº4, de la cual se evaluaron 3 probetas que luego de ser sometidas al ensayo triaxial reportan como conclusión que el esfuerzo de cizalladura corresponde a 46,16 kPa y el ángulo de resistencia al cizallamiento es de 32,37 degrees, siendo su contenido de humedad 26%, su Límite Líquido LL 34, su Límite Plástico LP 25, su índice de Plasticidad IP 9, correspondiendo a una clasificación de suelo SUCS ML (Limo Arenoso) cuya granulometría se define compuesta por 0% de grava, 32 % de arena y 68% de finos, sin contenido orgánico.

En el oficio anterior se adjuntó la planificación de conformación de plataformas y sus bermas donde se observa que el talud planificado tiene un ángulo de inclinación menor al definido en el estudio de estabilidad de la PUCE, con lo cual confirmamos que estamos usando un factor de

## MONITOREO CALIDAD DEL AGUA DE ESCORRENTÍA E INFILTRACIÓN DE LA ESCOMBRERA.

- El informe de resultados del Laboratorio Analítico Ambiental de Agua - Efluentes Industriales LASA, evidencia que el parámetro de Demanda Química de Oxígeno DQO no se cumple, sin embargo indicamos que hemos realizado un nuevo monitoreo para analizar todos los parámetros de la Tabla 9 de límites de descarga a un cuerpo de agua dulce de la Norma Técnica – Anexo 1-1, cuyos resultados serán entregados en 15 días.

Sírvase encontrar adjunto los informes de laboratorio de las entidades mencionadas.

Atentamente,

Ing. Rodrigo Almeida  
Director de Obra

En el oficio anterior se adjuntó la planificación de conformación de plataformas y sus bermas donde se observa que el talud planificado tiene un ángulo de inclinación menor al definido en el estudio de estabilidad de la PUCE, con lo cual confirmamos que estamos usando un factor de

### FACTOR DE SEGURIDAD

| FASE | PUCE   | PLANIFICADO | EJECUTAR | FACTOR<br>SEGURIDAD |
|------|--------|-------------|----------|---------------------|
| I    | ÁNGULO | 26,73       |          | 26                  |
| II   | ÁNGULO | 32,37       | 19,65    | 27                  |

seguridad de 1,2 si conformamos las plataformas de modo que entre el pie de la escombrera y la cima se enmarque un ángulo de 27 grados.

La ejecución de la operación de la escombrera busca el cumplimiento de esta premisa.

### FACTOR DE SEGURIDAD

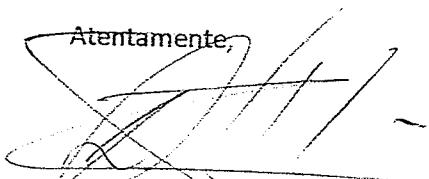

| FASE | PUCE   | PLANIFICADO | EJECUTADO | FACTOR<br>SEGURIDAD |
|------|--------|-------------|-----------|---------------------|
| I    | ÁNGULO | 26,73       |           | 26                  |
| II   | ÁNGULO | 32,37       | 19,65     | 27                  |

12. Las dimensiones del muro de tierra que trabajará para resistir los suelos saturados, son las dimensiones de ancho de berma superior, talud de berma, plataforma superior que permite el tránsito de la excavadora que conforma y del rodillo que compacta, altura del muro, altura de la berma de base.
13. Las propiedades de los suelos de conformación del muro y del relleno que contendrá, fueron estudiados en los laboratorios de la PUCE determinando el peso específico del suelo, ángulo de fricción interna, capacidad portante del terreno, coeficiente de fricción entre suelos.
14. Los resultados del estudio son satisfactorios y comprueban la bondad de lo implementado hasta el momento.
15. Continuamos con el monitoreo de los mojones testigos ubicados en diferentes sitios de la escombrera El Troje 4 que a 4 de octubre de 2017 atestiguan:
